vsl-port-banner-grabber: ask a port what it is

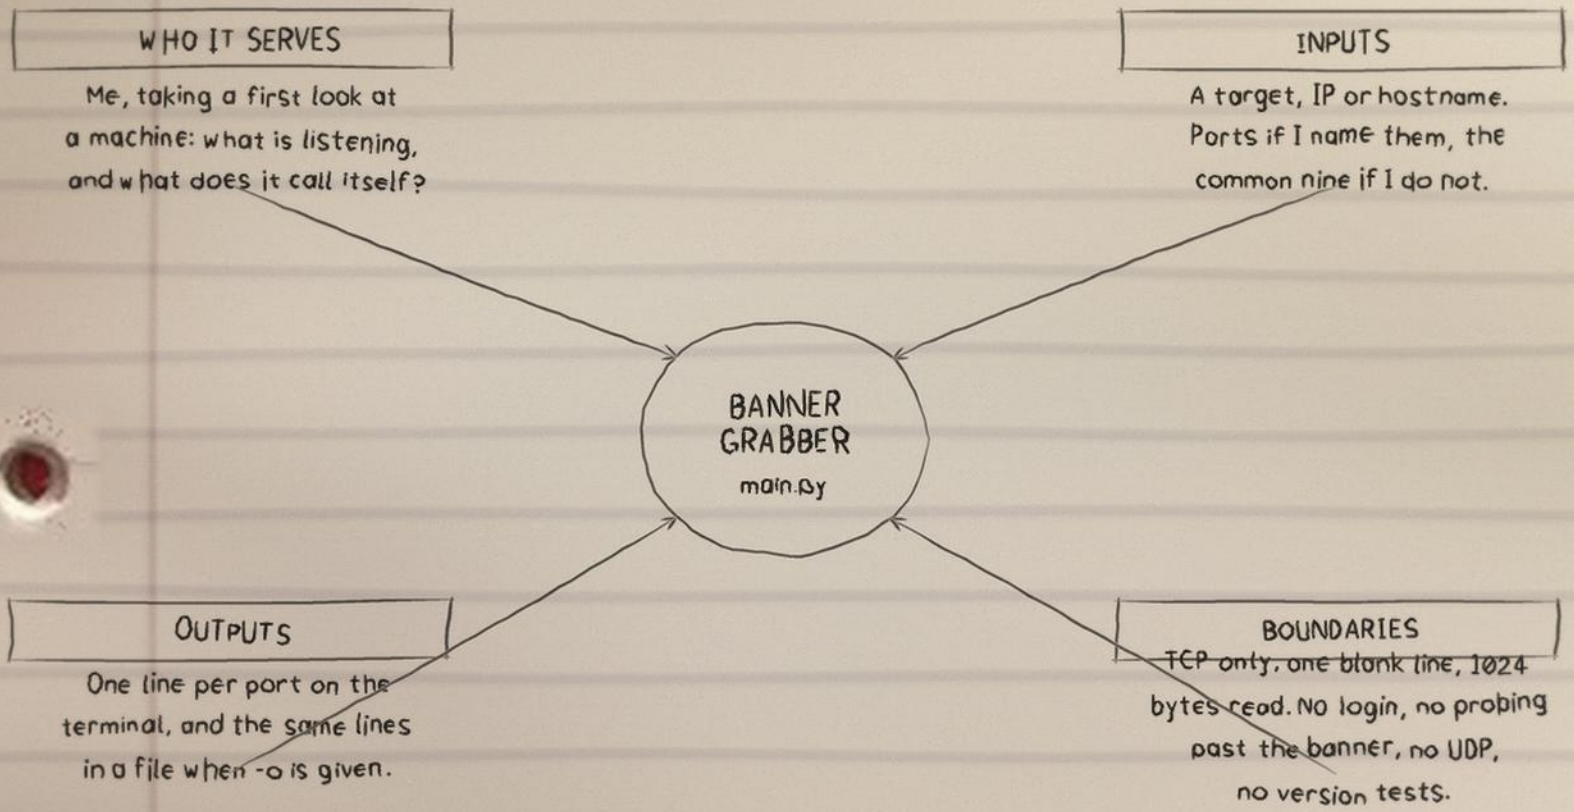

Default ports when -p is absent: 80, 443, 22, 21, 25, 110, 143, 3306, 8080.

main.py also imports nmap and tldextract and never calls them. The scan runs on socket alone.

A scan, followed port by port

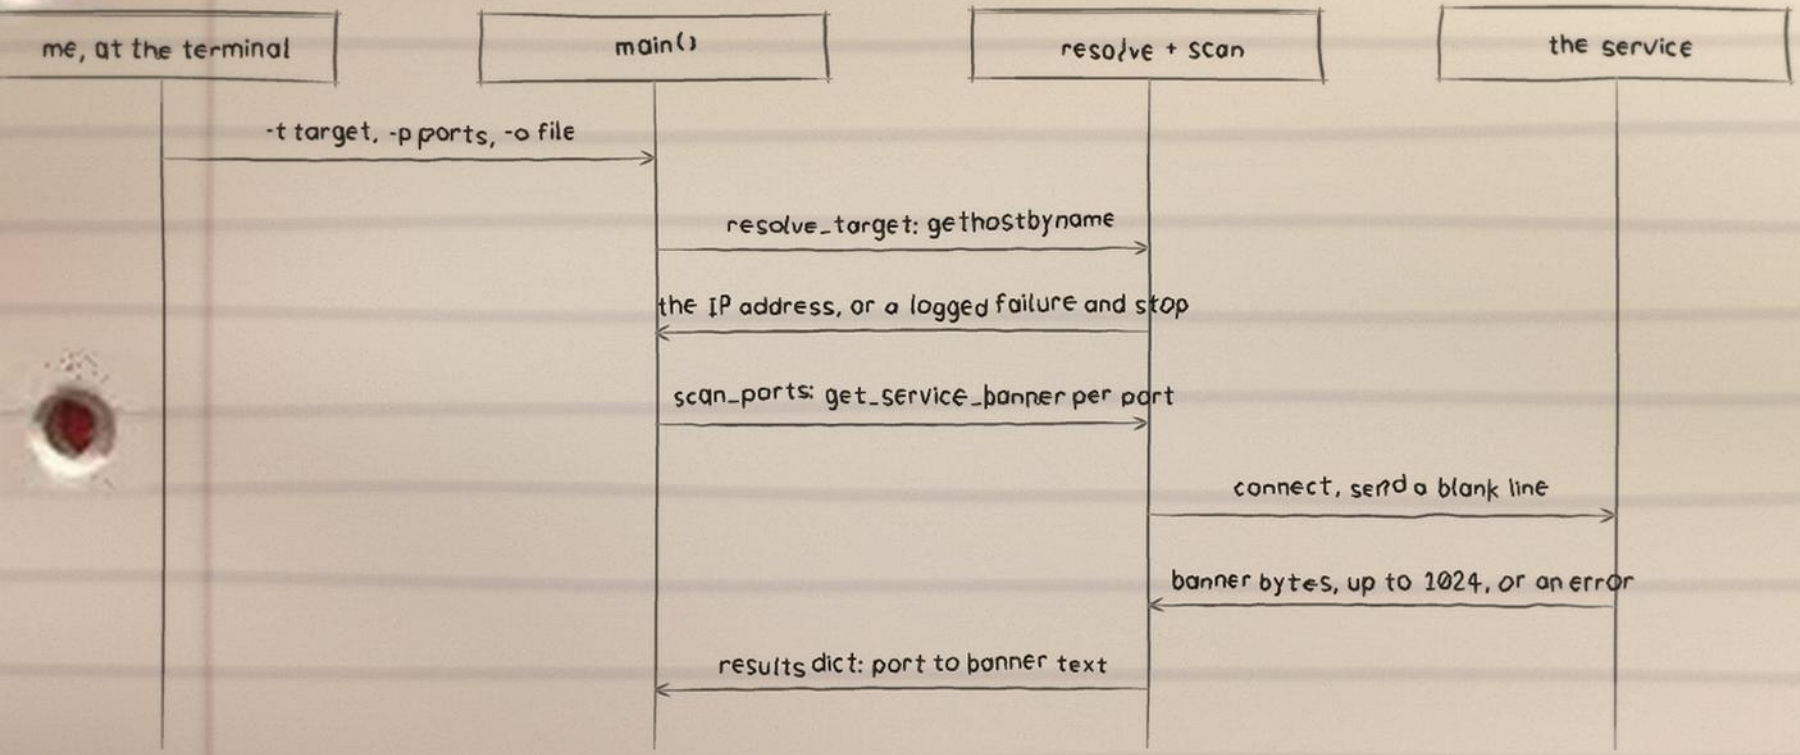

Product map: one question, asked of open ports

GR

Sequence: one port, one exchange

then main() prints Port <n>: <banner> for each port, and writes the file if -o was given.

noted by GK

vsl-port-banner-grabber in numbers, counted 2026-10-30

Lines by kind, from git ls-files and a line count over each tracked text file. There are no image files in this repo.

The whole repo is 4 files and 5 commits, every one of them dated 2025-01-02, from git log.
The license text is most of the repo by lines. The tool itself is the 143 line main.py.
Tests: none in the repo, and the tool would not start in my sandbox: nmap is imported but not installed here.
Full table, with the counting method behind every number, in VISUAL.md in this folder.
